1. Introduction

1.1 About This Engagement

Scalezix Ventures LLP has been engaged to design, develop, and implement the OfficeX Workplace Operations Platform — a digital ecosystem intended to transform how commercial real estate is discovered, managed, and operated across India. Before any architecture is finalized or any line of code is written, it is essential that both OfficeX and Scalezix share a precise, documented, and mutually validated understanding of the business this platform is meant to serve.

This Business Understanding Document (BUD) represents that shared understanding. It is not a technical specification, nor is it a commercial proposal. It is a business-first analysis that captures the industry context, the operational realities of commercial facility management in India, the strategic ambitions of OfficeX, and the rationale behind every major product decision that will follow in subsequent technical documents.

1.2 Why a Business Understanding Document Matters

Many technology projects fail not because of poor engineering, but because of a misalignment between what was built and what the business actually needed. A platform can be technically flawless and still fail commercially if it does not reflect how vendors actually behave, how property owners actually make decisions, or how facility management procurement actually happens on the ground in India.

This document exists to eliminate that risk. By documenting our understanding in writing — and inviting OfficeX to validate, correct, and refine it — we ensure that the Functional Requirement Specification, Technical Design Document, and ultimately the platform itself, are built on a foundation of genuine business understanding rather than assumption.

1.3 How This Document Was Developed

This document synthesizes:

- Analysis of the OfficeX Request for Proposal and supporting materials
- Scalezix's independent research into the Indian commercial real estate and facility management sector
- Comparative analysis of adjacent global and domestic marketplace and workplace-operations platforms

- Scalezix's prior experience building B2B marketplaces, vendor platforms, and enterprise operations software
- Structured assumptions, clearly flagged throughout, where direct client input was not yet available

Every section that contains an assumption rather than a confirmed fact is intended to be reviewed jointly with OfficeX stakeholders during the validation workshop that follows this document's submission.

1.4 Relationship to Other Project Documents

This BUD is the first in a series of foundational documents that together form the complete project documentation suite:

Document	Purpose
Executive Proposal	Commercial offer, technology vision, and investment summary
Business Understanding Document (this document)	Deep business and industry understanding
Functional Requirement Specification	Detailed feature-by-feature requirements
Technical Design Document	System architecture, data models, and engineering blueprint
Commercial Proposal	Final pricing, milestones, and contractual terms

Each subsequent document builds directly on the understanding captured here. Where this document says "OfficeX intends to X," the Functional Requirement Specification will say "the system shall provide capability Y to achieve X."

2. Purpose and Scope of This Document

2.1 Purpose

The purpose of this Business Understanding Document is fourfold:

1. To demonstrate that Scalezix has developed a genuine, non-superficial understanding of the commercial real estate and facility management industry that OfficeX operates within.
2. To articulate the business problems OfficeX is attempting to solve, independent of any specific technology solution.
3. To document the business model, stakeholder ecosystem, and value flows that the platform must support.
4. To establish a shared vocabulary and shared mental model between OfficeX and Scalezix before detailed technical work begins.

2.2 Scope

This document covers the business and industry context relevant to the OfficeX Workplace Operations Platform across its four strategic pillars: the Commercial Property Marketplace, the Facility Management Marketplace, Enterprise Workplace Software, and Managed Services. It intentionally excludes technical architecture, data schemas, API specifications, and UI/UX design — these are addressed in the Technical Design Document and Functional Requirement Specification respectively.

2.3 Intended Audience

This document is intended for:

- OfficeX founders, leadership, and product stakeholders
- OfficeX operations and business development teams
- Scalezix's project management, business analysis, and engineering leadership
- Any future investor, partner, or advisor who requires a business-level understanding of the platform without needing technical depth

2.4 How to Use This Document

OfficeX stakeholders are encouraged to read this document section by section and flag any statement that does not accurately reflect their business reality. Sections marked as "Assumption" should be treated as open questions requiring explicit confirmation or correction, not as settled fact.

3. The Commercial Real Estate Industry

3.1 Industry Overview

Commercial real estate encompasses all property used explicitly for business purposes — office buildings, retail complexes, industrial and warehouse facilities, healthcare infrastructure, and mixed-use developments. In India, this sector has evolved rapidly over the past two decades, driven by economic liberalization, the growth of the services sector, and increasingly, the expansion of Global Capability Centers established by multinational organizations.

Unlike residential real estate, commercial real estate is characterized by longer transaction cycles, higher-value contracts, more sophisticated buyer and tenant expectations, and a far greater dependency on ongoing operational services after the initial transaction is complete. A commercial building is not a one-time sale; it is an asset that requires continuous management, maintenance, compliance, and optimization for the entirety of its operational life.

3.2 Structure of the Indian Commercial Real Estate Market

The Indian commercial real estate market can be broadly segmented into:

- **Office Spaces** — traditional corporate offices, IT parks, and business districts
- **Flexible Workspaces** — co-working and managed office formats serving startups, freelancers, and enterprise satellite teams
- **Industrial and Warehouse Infrastructure** — logistics parks, fulfillment centers, and manufacturing facilities
- **Retail Developments** — malls, high streets, and standalone commercial complexes
- **Healthcare Infrastructure** — hospitals, diagnostic centers, and medical office buildings
- **Mixed-Use Developments** — integrated townships combining commercial, residential, and retail components

Each of these segments carries distinct facility management requirements, but all share a common operational dependency: the building must be maintained, serviced, secured, and kept compliant — and this is where the Facility Management industry intersects directly with commercial real estate.

3.3 Growth Drivers

Several structural forces are driving sustained growth in India's commercial real estate sector:

- **Global Capability Centers (GCCs):** Multinational organizations continue to establish technology, engineering, and operations centers across major Indian cities, each requiring large-scale, professionally managed office space.
- **Flexible Workspace Adoption:** Enterprises increasingly favor flexible and managed office formats over traditional long-term leases, accelerating demand for professionally operated commercial space.
- **Infrastructure and Logistics Expansion:** The growth of e-commerce and manufacturing has driven significant expansion in warehouse and industrial real estate.
- **Urbanization and Tier-2 City Growth:** Commercial development is increasingly extending beyond traditional metros into emerging business hubs.
- **Healthcare Sector Expansion:** Growing investment in hospital and diagnostic infrastructure is creating a new category of commercial facility management demand.

3.4 The Operational Layer Beneath Real Estate

While real estate transactions — leasing, buying, selling — receive the majority of industry attention and existing digital investment, the operational layer beneath these transactions remains comparatively under-digitized. Every commercial building, regardless of segment, requires ongoing services: housekeeping, security, electrical and mechanical maintenance, fire safety compliance, pest control, landscaping, and more. This operational layer is where OfficeX is strategically positioned.

3.5 Why This Matters for OfficeX

OfficeX's strategic opportunity lies precisely in this gap. While numerous platforms exist to facilitate property discovery and leasing transactions, comparatively few platforms address the continuous operational lifecycle that follows. OfficeX is not competing in the crowded property-listing space; it is building the operating system for what happens after a building is leased, purchased, or constructed.

Assumption: OfficeX's primary near-term focus is the operational and facility management layer rather than the property transaction layer. This should be explicitly confirmed.

4. Workplace Operations: An Industry Overview

4.1 Defining Workplace Operations

Workplace Operations refers to the complete set of activities required to keep a commercial building functional, safe, compliant, and productive on a day-to-day basis. This includes Facility Management, Integrated Facility Management, Computer-Aided Facilities Management, vendor coordination, compliance management, and increasingly, data-driven operational optimization.

4.2 The Facility Management Sub-Industry

Facility Management (FM) is itself a large and fragmented industry in India, broadly divided into:

- **Hard FM Services:** Electrical systems, heating ventilation and air conditioning, plumbing, fire safety systems, elevators, and structural maintenance
- **Soft FM Services:** Housekeeping, security, landscaping, pest control, and concierge services
- **Specialized Services:** Compliance audits, energy management, and sustainability consulting

This industry is characterized by a large number of small and mid-sized regional service providers, limited standardization, and minimal digital infrastructure for discovery, procurement, or performance tracking. Larger Integrated Facility Management (IFM) players exist and serve enterprise clients, but a significant share of the market remains served by fragmented, locally operating vendors who are difficult for building owners to discover, evaluate, and manage at scale.

4.3 Integrated Facility Management (IFM)

Integrated Facility Management refers to a service delivery model where multiple individual facility services — security, housekeeping, maintenance, and more — are bundled and delivered by a single accountable service provider under one contract. IFM has grown in popularity among large enterprises seeking to reduce vendor management overhead, but remains inaccessible or unnecessarily expensive for small and mid-sized commercial property owners who do not have the scale to negotiate enterprise IFM contracts.

OfficeX's marketplace model has the potential to democratize access to IFM-equivalent outcomes — multiple coordinated services, transparent pricing, and accountable performance — without requiring building owners to negotiate large enterprise contracts.

4.4 Computer-Aided Facilities Management (CAFM)

Computer-Aided Facilities Management refers to software systems used to digitally manage workplace operations: asset registries, maintenance scheduling, space utilization, work order tracking, compliance documentation, and operational reporting. CAFM adoption in India remains relatively low outside of large enterprise and multinational-occupied buildings, primarily due to cost, complexity, and the lack of accessible, mid-market-oriented CAFM products.

This represents a second strategic opportunity for OfficeX: not only as a marketplace connecting owners with vendors, but eventually as a CAFM-equivalent operational software layer accessible to a much broader segment of the market than current enterprise CAFM vendors serve.

4.5 The Workplace Operations Value Chain

The full workplace operations value chain can be represented as follows:

Property Identification → Leasing or Ownership → Facility Setup → Ongoing Maintenance & Services → Vendor Management → Compliance & Reporting → Asset Lifecycle Management → Renewal or Exit

Most existing digital platforms in India address only the first one or two stages of this chain — property identification and leasing. OfficeX's ambition, as we understand it, is to extend digital coverage across the entire value chain, positioning the platform as a continuous operational partner rather than a one-time transactional intermediary.

4.6 Industry Digitization Maturity

Compared to adjacent industries such as e-commerce, financial services, or even residential real estate, the commercial facility management industry remains in an early stage of digital maturity. Most procurement still happens through phone calls, WhatsApp messages, and personal relationships. Quotation comparison is informal. Vendor performance is tracked, if at all, through internal spreadsheets rather than structured, comparable data. This low digital maturity is precisely what creates the opportunity OfficeX is pursuing — and also what creates the primary adoption challenge the platform must be designed to overcome.

5. The OfficeX Business Model

5.1 Business Model Overview

Based on our understanding of the Request for Proposal, OfficeX's business model is structured around four interconnected layers, each contributing to a different revenue stream and serving a different stage of the customer relationship:

1. **Marketplace Layer** — Transactional revenue through vendor discovery, request-for-quotation facilitation, and marketplace commissions
2. **Software as a Service Layer** — Subscription revenue through workplace operations software sold to building owners and property managers
3. **Managed Services Layer** — Service revenue through OfficeX-delivered or OfficeX-coordinated facility management operations
4. **Artificial Intelligence Layer** — Future premium revenue through AI-powered operational intelligence, automation, and decision support

5.2 Layer 1: The Marketplace

The Marketplace layer functions as the customer acquisition and trust-building foundation of the OfficeX business. Building owners and property managers use the marketplace to discover verified vendors, request quotations, compare proposals, and award work. OfficeX captures value through commission on facilitated transactions and, potentially, premium placement or verification fees from vendors seeking greater visibility.

This layer is deliberately designed to be the lowest-friction entry point into the OfficeX ecosystem — a building owner does not need to commit to a subscription or long-term contract to experience initial value from the platform.

5.3 Layer 2: Software as a Service

Once a building owner or property manager has experienced value through the marketplace, OfficeX's strategy — as we understand it — is to convert them into subscribers of workplace operations software: tools for asset management, maintenance scheduling, compliance tracking, vendor management, and reporting. This layer transforms OfficeX from a transactional marketplace into an embedded operational system of record.

This is a classic and proven expansion strategy in B2B platform businesses: use a marketplace or transactional product to acquire customers at low friction, then expand into recurring, higher-margin software revenue once trust and habitual usage have been established.

5.4 Layer 3: Managed Services

For customers who prefer not to manage facility operations themselves even with software tools, OfficeX intends to offer Managed Services — effectively operating as an Integrated Facility Management provider, either directly or through a coordinated network of verified vendors operating under OfficeX's quality and accountability framework. This layer carries the highest revenue potential per customer but also the highest operational complexity, as OfficeX would be assuming direct accountability for service outcomes rather than merely facilitating connections.

Assumption: Managed Services will be introduced in a later phase rather than at initial platform launch. This should be confirmed, as it materially affects the scope and sequencing of the platform build.

5.5 Layer 4: Artificial Intelligence

The Artificial Intelligence layer represents the long-term differentiation strategy. As the platform accumulates structured data — vendor performance histories, quotation patterns, maintenance records, compliance timelines — this data becomes the foundation for predictive maintenance recommendations, intelligent vendor matching, automated cost estimation, and ultimately an AI-powered workplace assistant capable of proactively managing operational decisions on behalf of building owners.

This layer cannot be built in isolation; it depends entirely on the structured data generated by the Marketplace and Software as a Service layers functioning correctly first. This dependency directly informs the phased Future Product Roadmap detailed later in this document.

5.6 Revenue Model Summary

Layer	Primary Revenue Mechanism	Customer Relationship
Marketplace	Transaction commission, vendor verification fees	Transactional, low commitment
Software as a Service	Recurring subscription	Operational, habitual
Managed Services	Service contracts, retainers	Deep, high-trust, high-margin
Artificial Intelligence	Premium feature add-ons	Strategic, differentiated

5.7 Why This Layered Model Makes Strategic Sense

This layered approach mirrors successful patterns observed in adjacent global markets, where vertical marketplaces evolve into embedded software platforms over time (a pattern often described as "marketplace-to-SaaS" expansion). By sequencing Marketplace before Software as a Service, and Software as a Service before Managed Services and Artificial Intelligence, OfficeX reduces go-to-market risk: each layer builds trust, data, and customer relationships that make the next layer easier to sell.

6. Current Industry Challenges

6.1 Overview

This section documents the specific, structural challenges within the commercial facility management industry that the OfficeX platform is designed to address. Understanding these challenges in depth is essential to ensuring the platform's features map directly to genuine pain points rather than assumed ones.

6.2 Challenge: Fragmented Vendor Discovery

Building owners and property managers currently discover facility management vendors primarily through personal referrals, broker relationships, or informal local networks. There is no centralized, trustworthy directory of verified vendors segmented by service type, geography, and quality rating. This fragmentation disproportionately disadvantages smaller property owners and managers without extensive industry networks, while larger enterprises rely on long-standing relationships that may not reflect current market pricing or service quality.

6.3 Challenge: Lack of Vendor Verification

In the absence of a centralized verification mechanism, building owners bear the full burden of vetting vendor legitimacy, compliance documentation, insurance coverage, and past performance. This due diligence is time-consuming, inconsistent, and often skipped entirely under time pressure — exposing building owners to operational and legal risk.

6.4 Challenge: Manual and Opaque Procurement

The request-for-quotation process for facility management services is typically conducted through phone calls, emails, and WhatsApp messages, with no structured format for comparing quotations across vendors. This makes price comparison difficult, increases the likelihood of inconsistent scope definitions between competing vendors, and significantly extends procurement cycle times.

6.5 Challenge: Inconsistent Service Quality and No Performance History

Because vendor performance is rarely tracked in a structured, comparable format, building owners have no reliable way to evaluate a vendor's track record before engagement. Poor past performance with one client does not surface as a warning signal to the next potential client, and strong performance is similarly invisible — disadvantaging high-quality vendors who lack name recognition.

6.6 Challenge: Manual Work Order and Compliance Tracking

Once work is awarded, tracking execution, completion, and compliance documentation typically happens through spreadsheets, physical files, or fragmented digital tools not designed for facility management workflows. This creates risk during compliance audits and makes it difficult to maintain an accurate, auditable record of work performed.

6.7 Challenge: Manual Payment and Commission Reconciliation

Invoice generation, payment processing, and any intermediary commission calculations are typically handled manually, creating reconciliation overhead, payment delays, and disputes between parties regarding amounts owed.

6.8 Challenge: Absence of Business Intelligence

Because data is not captured in a structured, centralized system, building owners, property managers, and platform operators alike lack access to meaningful business intelligence: spending trends, vendor performance benchmarks, maintenance cost forecasting, or operational efficiency metrics.

6.9 Challenge: Low Digital Trust in the Category

Given the historically informal nature of facility management procurement, there is an inherent trust barrier to overcome when introducing a digital marketplace. Both building owners and vendors must be convinced that the platform offers genuine value — verified counterparties, transparent pricing, and reliable transaction completion — before they shift meaningful procurement activity onto it.

6.10 Summary Table of Challenges and Implications

Challenge	Business Implication
Fragmented vendor discovery	High customer acquisition friction for new building owner segments
Lack of vendor verification	Trust deficit; risk of platform being associated with poor vendor experiences
Manual, opaque procurement	Long sales cycles; difficulty proving platform value quickly
No performance history	Difficult to differentiate quality vendors; risk of adverse selection
Manual work order tracking	Compliance risk; reduces stickiness of any non-software solution
Manual payment reconciliation	Operational overhead; delayed commission realization
Absence of business intelligence	Limits long-term Software as a Service and AI monetization potential
Low digital trust	Requires deliberate trust-building features in early platform design

7. Existing Process Analysis (As-Is State)

7.1 Purpose of This Section

To design an effective digital replacement, it is necessary to first document, in detail, how facility management procurement and operations currently function without a platform like OfficeX. This "as-is" process mapping ensures that the digital workflows we design later genuinely improve upon — rather than awkwardly digitize — existing behavior.

7.2 As-Is Process: Vendor Discovery

Currently, when a building owner or property manager requires a facility management service, the typical process is as follows:

1. The need is identified internally (e.g., housekeeping contract expiring, new electrical maintenance requirement)
2. The owner or manager consults personal or professional networks for vendor recommendations
3. Alternatively, a broker or existing vendor is asked for referrals
4. A shortlist of two to four vendors is typically compiled, often based on familiarity rather than rigorous comparison
5. Initial contact is made via phone call or WhatsApp

This process is slow, network-dependent, and structurally biased toward vendors who are already well-connected rather than necessarily the best fit for the specific requirement.

7.3 As-Is Process: Quotation and Procurement

1. Each shortlisted vendor is contacted individually, often describing the requirement verbally or via informal text message
2. Vendors typically conduct a site visit before quoting
3. Quotations are returned in inconsistent formats — PDF, WhatsApp text, email, or verbally over a phone call
4. Because each vendor may interpret the scope slightly differently, true apples-to-apples comparison is difficult
5. Negotiation happens informally, often without documentation of final agreed terms
6. A vendor is selected, frequently based on relationship and trust rather than fully transparent price-performance comparison

7.4 As-Is Process: Work Execution and Tracking

1. Work commences based on a verbal or loosely documented agreement
2. Progress tracking, if it occurs, happens through manual site visits or informal check-ins
3. Issues or delays are communicated reactively, often without a documented escalation process
4. Completion is confirmed informally, sometimes without a formal sign-off process

7.5 As-Is Process: Invoicing and Payment

1. The vendor raises an invoice, often manually prepared and shared via email or WhatsApp
2. Payment is processed through standard bank transfer, frequently with delays
3. No centralized record exists linking the invoice to the original quotation, work order, or performance outcome
4. Disputes, when they arise, are difficult to resolve due to lack of documented agreement terms

7.6 As-Is Process: Performance Evaluation

1. Performance evaluation, where it happens at all, is informal and undocumented
2. Knowledge of vendor quality is retained as institutional memory within the building owner's organization rather than captured in any shareable or comparable format
3. This knowledge is lost when key personnel change roles, and is never made available to other building owners who might benefit from it

7.7 As-Is Process Map (Summary Flow)

Need Identified → Informal Network Search → Manual Vendor Outreach → Inconsistent Quotations → Informal Negotiation → Verbal/Loose Agreement → Manual Execution Tracking → Manual Invoicing → Bank Transfer Payment → Undocumented Performance Memory

7.8 Key Observations from As-Is Analysis

- Nearly every step in the current process relies on informal communication channels (phone, WhatsApp, email) rather than structured systems
- There is no single point in the process where data is captured in a reusable, comparable format

- Trust is established through personal relationships rather than platform-mediated verification
- The process disproportionately favors incumbents — vendors and building owners who already know each other — over new entrants on either side

These observations directly inform the design priorities for the To-Be state described in the next section: the digital process must not simply replicate these informal steps online, but must introduce structure, comparability, and trust mechanisms at each stage.

8. Proposed Digital Transformation (To-Be State)

8.1 Transformation Philosophy

The digital transformation proposed for OfficeX is not a one-to-one digitization of the existing manual process. Simply moving phone calls to chat messages or PDFs to file uploads would replicate the inefficiencies of the current system in digital form. Instead, the transformation introduces structural improvements at each stage of the value chain: standardized data capture, comparable quotation formats, verified vendor identities, and persistent performance records that compound in value over time.

8.2 To-Be Process: Vendor Discovery

In the proposed digital model, a building owner searches a centralized, verified vendor directory filtered by service category, geography, and vendor rating. Vendor profiles display verification status, service history, ratings, and reviews — replacing informal network-based discovery with structured, comparable, platform-mediated discovery.

8.3 To-Be Process: Request for Quotation

Building owners submit a structured Request for Quotation specifying service category, scope details, location, and timeline through a standardized digital form. This structured format is distributed simultaneously to multiple matched vendors, ensuring every vendor quotes against an identical scope definition — solving the apples-to-oranges comparison problem inherent in the as-is process.

8.4 To-Be Process: Quotation Comparison and Award

Vendors submit quotations through the platform in a standardized format, enabling side-by-side comparison of pricing, scope, and vendor rating within a single interface. The building owner can award the work directly through the platform, generating a digitally recorded agreement that becomes the system of record for the engagement.

8.5 To-Be Process: Work Order Execution

Once awarded, the engagement becomes a trackable Work Order within the platform, with status updates, milestone tracking, and structured completion confirmation — replacing informal site-visit-based tracking with a persistent digital record accessible to both parties.

8.6 To-Be Process: Digital Invoicing and Payment

Invoices are generated within the platform, directly linked to the originating Request for Quotation and Work Order. Payments are processed through an integrated digital payment gateway, with commission calculations handled automatically — eliminating manual reconciliation overhead for both OfficeX and its marketplace participants.

8.7 To-Be Process: Structured Performance Evaluation

Upon work completion, both parties provide structured ratings and reviews, which become a permanent part of the vendor's platform profile. Over time, this creates a compounding data asset: the more transactions that flow through the platform, the more valuable vendor performance data becomes for future building owners making procurement decisions.

8.8 To-Be Process Map (Summary Flow)

Need Identified → Search Verified Vendor Directory → Submit Structured Request for Quotation → Receive Comparable Quotations → Award via Platform → Track Work Order → Digital Invoice & Payment → Structured Review → Persistent Performance Record

8.9 Transformation Impact Summary

Process Stage	As-Is Limitation	To-Be Improvement
Discovery	Network-dependent, biased toward incumbents	Verified, searchable, comparable directory
Quotation	Inconsistent scope, hard to compare	Standardized format, true comparison
Agreement	Informal, undocumented	Digitally recorded, auditable
Execution	Manual tracking, reactive issue handling	Structured work order tracking

Payment	Manual invoicing, delayed reconciliation	Integrated digital payments and commissions
Performance	Undocumented, lost institutional knowledge	Persistent, structured, platform-wide record

8.10 Change Management Considerations

Digital transformation of this nature succeeds or fails based on adoption, not merely on the quality of the technology. Both building owners and vendors are accustomed to relationship-based, informal processes. The platform must therefore be designed with deliberate attention to onboarding simplicity, trust-building features (verification badges, transparent ratings), and early demonstrable value — rather than assuming that structural superiority alone will drive adoption.

Assumption: OfficeX will support early platform adoption through a hands-on, concierge-style onboarding approach for initial vendor and building owner cohorts, rather than relying solely on self-service signup. This should be validated, as it has implications for both the platform's admin tooling requirements and the go-to-market plan.

9. The Marketplace Model

9.1 Marketplace Fundamentals

OfficeX's Facility Management Marketplace is fundamentally a two-sided marketplace, connecting building owners and property managers (demand side) with facility management vendors (supply side). Like all two-sided marketplaces, its success depends on solving the "chicken-and-egg" problem: building owners will not engage with a marketplace that lacks sufficient verified vendors, while vendors will not invest effort in platform participation without sufficient transaction volume from building owners.

9.2 Demand Side: Building Owners and Property Managers

The demand side of the marketplace consists of:

- Individual commercial property owners
- Property management companies managing portfolios on behalf of owners
- Corporate real estate teams managing owned or leased office space
- Asset managers overseeing institutional commercial real estate portfolios

Each of these segments has distinct procurement behavior, decision-making authority structures, and price sensitivity, which should inform differentiated onboarding and engagement strategies.

9.3 Supply Side: Facility Management Vendors

The supply side consists of facility management service providers across categories including housekeeping, security, electrical and mechanical maintenance, fire safety, pest control, landscaping, and specialized compliance services. This supply side is characterized by significant heterogeneity — ranging from small local operators serving a single neighborhood to larger regional or national players capable of serving enterprise accounts across multiple cities.

9.4 Trust Mechanisms

Trust is the central currency of any marketplace, and particularly so in a category like facility management where service quality directly affects building operations and occupant safety. The marketplace model must incorporate the following trust mechanisms:

- **Vendor Verification:** Document-based verification of business registration, compliance certificates, and insurance coverage
- **Ratings and Reviews:** Structured, post-engagement feedback visible to future building owners
- **Transaction History:** Visible record of completed engagements, building vendor credibility over time
- **Dispute Resolution:** A documented process for handling disagreements between building owners and vendors

9.5 Commission and Monetization Structure

OfficeX's marketplace revenue is expected to derive primarily from commission on facilitated transactions, calculated as a percentage of the awarded quotation value. Additional monetization opportunities may include premium vendor placement, verification fee structures, or subscription-based vendor tiers offering enhanced visibility.

Assumption: Commission rates and structures will be finalized by OfficeX based on competitive market analysis. This Business Understanding Document assumes a percentage-of-transaction commission model as the primary mechanism, to be confirmed.

9.6 Liquidity and Network Effects

As the marketplace accumulates transaction volume, network effects begin to compound: more building owners attract more vendors seeking access to demand, and more vendors provide building owners with greater choice and competitive pricing, attracting further demand. Achieving this liquidity threshold — sufficient transaction density within specific geographic and service-category segments — is the primary early-stage business objective of the Marketplace layer.

9.7 Geographic Sequencing Strategy

Given the localized nature of facility management services (vendors typically serve a limited geographic radius), the marketplace likely needs to achieve liquidity city-by-city or even district-by-district rather than nationally all at once. This has direct implications for platform features such as location-based search and geographic vendor matching, as well as for go-to-market sequencing.

9.8 Marketplace Success Factors

Factor	Why It Matters
Vendor density per category and geography	Determines whether building owners receive sufficiently competitive quotations
Verification rigor	Determines trust and willingness to transact
Quotation turnaround speed	Determines whether the platform genuinely improves on manual processes
Transaction completion rate	Determines monetization realization, not just engagement
Repeat usage rate	Determines long-term retention and Software as a Service conversion potential

10. Software as a Service Strategy

10.1 Strategic Rationale

While the Marketplace layer drives initial customer acquisition, the Software as a Service layer is where OfficeX is expected to build durable, recurring revenue and deep customer relationships. Once a building owner has engaged with the platform through marketplace transactions, the natural expansion path is to offer them operational software tools that embed OfficeX into their daily workplace management workflow.

10.2 Core Software as a Service Capabilities

Based on industry-standard workplace operations software and the OfficeX vision, the Software as a Service layer is expected to encompass:

- **Asset Management:** Digital registry of building assets, equipment, and infrastructure
- **Maintenance Management:** Scheduled and reactive maintenance tracking with reminders and history
- **Vendor Management:** Centralized record of all engaged vendors, contracts, and performance across the property portfolio
- **Helpdesk and Ticketing:** Internal issue reporting and resolution tracking for building occupants and facility staff
- **Compliance Management:** Tracking of statutory compliance requirements, certificate renewals, and audit readiness
- **Space Management:** Utilization tracking and optimization of commercial space allocation
- **Reporting and Dashboards:** Portfolio-level visibility into operational spend, vendor performance, and compliance status

10.3 Target Customer Segments for Software as a Service

The Software as a Service layer is most relevant to customers managing multiple properties or larger single properties where the operational complexity justifies dedicated software tooling — property management companies, corporate real estate teams, and asset managers with institutional portfolios. Smaller, single-property owners may continue to rely primarily on the Marketplace layer without converting to a full Software as a Service subscription, at least in earlier phases.

10.4 Pricing Model Considerations

Software as a Service products in this category are typically priced through a combination of per-property and per-user subscription tiers, sometimes with usage-based components for transaction-heavy modules. The specific pricing structure should be informed by competitive benchmarking and customer willingness-to-pay research, which falls outside the scope of this Business Understanding Document but should be addressed prior to Software as a Service layer launch.

10.5 Marketplace-to-Software as a Service Conversion Path

A critical strategic question for OfficeX is how building owners transition from Marketplace users to Software as a Service subscribers. The recommended approach, based on proven patterns in adjacent B2B marketplace businesses, is to:

1. Allow building owners to experience marketplace value first, at low friction and no subscription commitment
2. Surface lightweight operational tools (e.g., basic vendor and work order tracking) as a natural extension of marketplace activity, building habitual usage
3. Introduce premium Software as a Service tiers once usage patterns indicate sufficient operational complexity to justify the investment

10.6 Data Continuity as a Competitive Moat

Because the Marketplace layer generates vendor performance data, transaction history, and work order records, building owners who have used OfficeX for marketplace transactions will find significantly more value in the Software as a Service layer than a new customer starting from zero — their operational history is already populated. This data continuity represents a meaningful retention and conversion advantage that should be deliberately reinforced in product design.

11. Managed Services Strategy

11.1 Strategic Rationale

The Managed Services layer represents the highest-touch, highest-margin tier of the OfficeX business model. Rather than connecting building owners with independent vendors or providing self-service software tools, OfficeX assumes direct operational accountability — functioning effectively as an Integrated Facility Management provider, either through directly employed resources or through a curated, accountable network of vendors operating under OfficeX's quality standards.

11.2 Service Categories

Managed Services offerings are expected to include:

- **Property Management:** End-to-end operational management of commercial properties on behalf of owners
- **Integrated Facility Management:** Bundled hard and soft FM services delivered under a single accountable contract
- **Building Operations:** Day-to-day operational oversight including staffing coordination and vendor supervision
- **Annual Maintenance Contracts:** Long-term maintenance agreements covering critical building systems
- **Compliance Audits:** Periodic statutory and safety compliance verification
- **Operational Consulting:** Advisory services for building owners seeking to optimize operational efficiency

11.3 Operational Complexity Considerations

Unlike the Marketplace and Software as a Service layers, which are primarily technology-delivered, Managed Services requires significant operational infrastructure: trained personnel, quality assurance processes, service-level agreement management, and direct accountability for outcomes. This represents a meaningfully different business — closer to a traditional facility management company than a software platform — and carries correspondingly different operational risk.

11.4 Sequencing Recommendation

Given this operational complexity, we recommend — and understand this aligns with OfficeX's own strategic thinking — that Managed Services be introduced as a later-phase offering, after the Marketplace and Software as a Service layers have established sufficient transaction volume, vendor network density, and operational data to support high-confidence service delivery. Launching Managed Services prematurely, before the underlying marketplace has achieved liquidity, risks both quality control challenges and capital inefficiency.

11.5 Managed Services as a Trust Amplifier

Even before full-scale launch, the existence of a Managed Services roadmap can serve as a trust signal to enterprise customers evaluating the platform — demonstrating that OfficeX is building toward comprehensive operational accountability rather than remaining a purely transactional intermediary.

Assumption: Managed Services will not be included in the initial platform build scope but should be architecturally anticipated, ensuring the data model and vendor network developed in earlier phases can support this expansion without major rearchitecture.

12. Artificial Intelligence Vision

12.1 Strategic Positioning

Artificial Intelligence represents the long-term differentiation layer of the OfficeX platform — not a feature bolted onto the marketplace, but a capability that becomes increasingly powerful as the platform accumulates structured operational data over time. The Artificial Intelligence vision should be understood as data-dependent: its value compounds with platform usage rather than existing as a standalone capability available from day one.

12.2 Foundational Data Requirements

For Artificial Intelligence capabilities to deliver genuine value rather than superficial novelty, the platform must first accumulate:

- Structured vendor performance histories across multiple engagements and categories
- Detailed quotation and pricing data across service types and geographies
- Maintenance and work order timelines and outcomes
- Compliance and renewal patterns across building types

This data accumulation is a direct function of Marketplace and Software as a Service layer usage, reinforcing the sequencing logic established earlier in this document.

12.3 Near-Term Artificial Intelligence Applications

Once sufficient data exists, near-term Artificial Intelligence applications include:

- **Intelligent Vendor Recommendation:** Matching building owners to the most suitable vendors based on historical performance, pricing competitiveness, and service category fit, rather than relying solely on manual search and filtering
- **Automated Cost Estimation:** Providing building owners with data-driven cost benchmarks for specific service requests before quotations are even received
- **Predictive Maintenance Recommendations:** Identifying likely maintenance needs based on asset age, historical patterns, and building characteristics

12.4 Medium-Term Artificial Intelligence Applications

- **Automated Bill of Quantities Generation:** Using historical project data to auto-generate draft scope and quantity estimates for new requests, reducing vendor quotation preparation time
- **Conversational Workplace Assistant:** A natural-language interface allowing building owners and facility managers to query operational status, request services, and receive recommendations conversationally

12.5 Long-Term Artificial Intelligence Vision

In its fullest expression, the Artificial Intelligence layer envisions OfficeX functioning as a proactive operational partner — surfacing recommendations before problems arise, automating routine procurement decisions within owner-defined parameters, and providing portfolio-level intelligence that would otherwise require a dedicated internal operations team to produce manually.

12.6 Risk and Governance Considerations

Artificial Intelligence recommendations that influence procurement and financial decisions carry inherent risk if deployed without appropriate guardrails. The platform's Artificial Intelligence strategy should incorporate transparency around recommendation logic, clear boundaries around fully automated versus human-approved actions, and ongoing monitoring for bias or systematic inaccuracy in vendor recommendations.

13. Future Product Roadmap

13.1 Roadmap Philosophy

The Future Product Roadmap presented here is intentionally phased, reflecting the dependency relationships established throughout this document: Marketplace liquidity enables Software as a Service expansion, Software as a Service usage enables Managed Services confidence, and accumulated data across all layers enables meaningful Artificial Intelligence capability. Attempting to launch all four layers simultaneously would dilute focus and increase execution risk without a corresponding increase in near-term business value.

13.2 Phase 1: Marketplace Foundation

Objective: Establish core marketplace functionality and achieve initial transaction liquidity in priority geographies.

- Vendor registration, verification, and profile management
- Building and property registration
- Request for Quotation creation and distribution
- Quotation comparison and award
- Basic work order tracking
- Digital payments and commission processing
- Ratings and reviews

13.3 Phase 2: Operational Depth

Objective: Deepen platform stickiness through enhanced operational tooling and early Software as a Service capability.

- Enhanced work order management with milestone tracking
- Basic asset management
- Maintenance scheduling and reminders
- Compliance tracking
- Portfolio-level reporting for multi-property owners

13.4 Phase 3: Software as a Service Expansion

Objective: Convert engaged marketplace users into recurring Software as a Service subscribers.

- Full Computer-Aided Facilities Management module suite
- Helpdesk and ticketing system
- Space management and utilization tracking
- Advanced business intelligence dashboards
- Tiered subscription pricing model

13.5 Phase 4: Managed Services Launch

Objective: Introduce direct operational accountability offerings for customers seeking comprehensive service delivery.

- Integrated Facility Management service packages
- Annual Maintenance Contract management
- Dedicated account management tooling
- Service-level agreement tracking and enforcement

13.6 Phase 5: Artificial Intelligence Layer

Objective: Deploy data-driven intelligence capabilities across the platform.

- Intelligent vendor recommendation engine
- Automated cost estimation
- Predictive maintenance recommendations
- Automated Bill of Quantities generation
- Conversational workplace assistant

13.7 Phase 6: Platform Ecosystem Expansion

Objective: Extend platform reach and embeddedness within the broader commercial real estate ecosystem.

- Native mobile applications for vendors and building owners
- Third-party integrations (accounting systems, enterprise resource planning, building management systems)
- Open application programming interface for partner and developer ecosystem

- Multi-tenant white-label capability for enterprise or regional partners

13.8 Roadmap Summary Table

Phase	Primary Focus	Key Dependency
Phase 1	Marketplace Foundation	None — foundational
Phase 2	Operational Depth	Phase 1 transaction volume
Phase 3	Software as a Service Expansion	Phase 2 operational data and usage habits
Phase 4	Managed Services Launch	Phase 3 customer trust and vendor network maturity
Phase 5	Artificial Intelligence Layer	Accumulated structured data across Phases 1–4
Phase 6	Platform Ecosystem Expansion	Established core platform stability and market position

13.9 Roadmap Flexibility

This roadmap should be treated as a strategic sequencing framework rather than a rigid timeline. Market feedback, competitive dynamics, and customer demand signals gathered during each phase should inform adjustments to subsequent phase scope and timing.

14. Stakeholder Ecosystem

14.1 Overview

The OfficeX platform serves a multi-sided stakeholder ecosystem, each with distinct needs, motivations, and success criteria. Understanding these stakeholders in depth is essential to designing a platform that genuinely serves each constituency rather than optimizing for one at the expense of others.

14.2 Building Owners

Building owners are individuals or organizations holding ownership of commercial property. Their primary motivations center on protecting asset value, minimizing operational cost and risk, and ensuring compliance. They are typically less involved in day-to-day operational decisions than property or facility managers but retain ultimate financial and legal accountability.

14.3 Property and Asset Managers

Property and asset managers are professionals or organizations responsible for the operational and financial performance of one or more commercial properties on behalf of owners. They are frequent platform users, directly engaged in vendor selection, budget management, and performance oversight. They represent a primary power-user segment whose workflow efficiency directly determines platform stickiness.

14.4 Facility Managers

Facility managers oversee the day-to-day operational execution within a building, coordinating directly with vendors and service staff. They are the most operationally embedded stakeholder group and are likely to be the most frequent users of work order tracking, helpdesk, and maintenance management tools.

14.5 Vendors

Vendors are the facility management service providers participating in the marketplace. Their primary motivation is access to qualified demand with minimized customer acquisition cost, alongside fair, timely payment and the opportunity to build a verifiable reputation that compounds over time. Vendor satisfaction is critical, as supply-side liquidity is foundational to marketplace function.

14.6 Platform Administrators

OfficeX's internal administrative team is responsible for vendor verification, dispute resolution, platform governance, and operational oversight of the marketplace. Their tooling requirements — administrative dashboards, verification workflows, and dispute management systems — are essential to platform integrity even though they are not externally customer-facing.

14.7 Finance Teams

Both within OfficeX and within building owner organizations, finance teams require accurate, auditable records of transactions, invoices, payments, and commission calculations. Their requirements center on accuracy, auditability, and integration with existing financial systems and processes.

14.8 Brokers and Future Tenants

While not the immediate primary focus of the Facility Management Marketplace, brokers and future tenants represent the stakeholder ecosystem relevant to OfficeX's broader Commercial Property Marketplace pillar, and should be considered in long-term platform design even if not prioritized in initial phases.

14.9 Stakeholder Needs Summary

Stakeholder	Primary Need	Key Success Metric
Building Owner	Asset protection, cost control, compliance	Reduced operational risk and cost
Property/Asset Manager	Efficient vendor and budget management	Time saved, transparent comparison
Facility Manager	Operational coordination and tracking	Faster issue resolution
Vendor	Access to qualified demand, fair payment	Transaction volume, timely payment

Platform Administrator	Governance and trust enforcement	Low dispute rate, high verification accuracy
Finance Team	Accurate, auditable records	Reconciliation accuracy and speed

15. Competitive Landscape

15.1 Landscape Overview

The competitive landscape relevant to OfficeX spans several adjacent categories, none of which fully replicate OfficeX's integrated four-layer model, but each of which competes for a portion of the value chain OfficeX intends to capture.

15.2 Property Listing Platforms

General commercial real estate listing platforms focus primarily on property discovery and leasing transactions. They typically do not address the post-transaction operational layer that forms OfficeX's core focus, representing limited direct overlap but a potential channel partnership or integration opportunity rather than a direct competitive threat.

15.3 Facility Management Service Aggregators

A smaller category of platforms attempts to aggregate facility management service providers for discovery purposes, though typically with limited depth in structured procurement, verification rigor, or post-transaction work order and payment management — areas where OfficeX's integrated approach is intended to differentiate.

15.4 Enterprise Integrated Facility Management Providers

Established Integrated Facility Management companies serve large enterprise clients directly through traditional service contracts rather than marketplace or software platforms. These providers compete primarily for the Managed Services layer of OfficeX's business model, particularly among larger enterprise accounts, but generally do not serve the mid-market and smaller property segments that OfficeX's marketplace model is well-positioned to reach.

15.5 Enterprise Computer-Aided Facilities Management Software Vendors

A category of established enterprise software vendors provides Computer-Aided Facilities Management tools, typically priced and positioned for large enterprise and multinational-occupied buildings. These vendors compete primarily within OfficeX's Software as a Service layer, though OfficeX's marketplace-driven customer acquisition and mid-market accessibility represent a meaningful differentiation against enterprise-focused incumbents.

15.6 OfficeX's Differentiated Position

OfficeX's primary competitive differentiation lies not in any single layer, but in the integration of all four layers into a single platform — using the Marketplace as a low-friction acquisition channel, expanding into Software as a Service for operational depth, offering Managed Services for customers seeking full accountability, and ultimately leveraging accumulated data for Artificial Intelligence-driven differentiation. Few, if any, existing competitors in the Indian market currently offer this integrated model.

15.7 Competitive Risk Considerations

- Established Integrated Facility Management providers could expand downward into mid-market segments, leveraging existing operational infrastructure
- Enterprise Computer-Aided Facilities Management vendors could introduce simplified, lower-cost offerings targeting the mid-market
- New, well-funded entrants could attempt to replicate OfficeX's integrated model directly

These risks reinforce the strategic importance of achieving marketplace liquidity and data accumulation quickly, as both represent durable competitive moats that are difficult for later entrants to replicate.

16. Risk Understanding

16.1 Purpose

This section documents the business-level risks Scalezix understands to be relevant to the OfficeX platform's success, independent of technical implementation risk (which is addressed separately in the Technical Design Document).

16.2 Marketplace Liquidity Risk

The central risk facing any two-sided marketplace is failure to achieve sufficient liquidity — enough vendors and enough building owner demand within specific geographic and category segments to create a self-reinforcing network effect. Mitigation requires deliberate geographic and category sequencing rather than attempting simultaneous national, all-category launch.

16.3 Trust and Adoption Risk

Given the historically informal, relationship-driven nature of facility management procurement, both building owners and vendors may be resistant to shifting established behavior onto a digital platform. Mitigation requires deliberate trust-building features and potentially hands-on onboarding support in early phases.

16.4 Vendor Quality Risk

Inadequate vendor verification could result in poor service experiences early in the platform's life, damaging trust before it has been firmly established. Mitigation requires rigorous verification processes, even if this limits initial vendor supply growth speed.

16.5 Operational Complexity Risk (Managed Services)

Premature expansion into Managed Services, before sufficient marketplace data and vendor network maturity exist, risks both service quality failures and capital inefficiency. Mitigation is addressed through the phased roadmap sequencing recommended in Section 13.

16.6 Data Quality Risk (Artificial Intelligence)

Artificial Intelligence capabilities built on insufficient or low-quality data risk producing inaccurate or untrustworthy recommendations, which could damage platform credibility. Mitigation requires disciplined sequencing, ensuring Artificial Intelligence features are only introduced once sufficient validated data exists.

16.7 Competitive Response Risk

As discussed in Section 15, established players in adjacent categories could respond to OfficeX's market entry by expanding their own offerings. Mitigation requires speed to liquidity and a focus on the integrated, full-lifecycle value proposition that is structurally difficult for single-layer competitors to replicate quickly.

16.8 Risk Summary Table

Risk Category	Severity	Primary Mitigation
Marketplace Liquidity	High	Geographic and category sequencing
Trust and Adoption	High	Verification, ratings, hands-on early onboarding
Vendor Quality	Medium-High	Rigorous verification processes
Managed Services Complexity	Medium	Phased roadmap, delayed launch
Artificial Intelligence Data Quality	Medium	Sequenced rollout dependent on data maturity
Competitive Response	Medium	Speed to liquidity, integrated value proposition

17. Success Metrics and Key Performance Indicators

17.1 Purpose

This section proposes a framework of success metrics aligned to the business understanding developed throughout this document. These metrics are intended to guide both OfficeX's internal performance tracking and Scalezix's prioritization of platform features that most directly support measurable business outcomes.

17.2 Marketplace Layer Metrics

- Number of verified vendors onboarded, by category and geography
- Number of active building owners and property managers
- Request for Quotation volume and response rate
- Quotation-to-award conversion rate
- Average procurement cycle time (request to award)
- Gross transaction value processed through the platform
- Commission revenue realized

17.3 Trust and Quality Metrics

- Vendor verification completion rate
- Average vendor rating
- Dispute rate as a percentage of completed transactions
- Repeat transaction rate (building owners returning for subsequent requests)

17.4 Software as a Service Layer Metrics (Future Phase)

- Marketplace-to-Software as a Service conversion rate
- Monthly recurring revenue
- Subscription churn rate
- Feature adoption rate across Software as a Service modules

17.5 Managed Services Layer Metrics (Future Phase)

- Managed Services contract value and count
- Service-level agreement compliance rate
- Customer retention rate within Managed Services accounts

17.6 Artificial Intelligence Layer Metrics (Future Phase)

- Recommendation acceptance rate
- Accuracy of predictive maintenance recommendations against actual outcomes
- Reduction in average procurement cycle time attributable to Artificial Intelligence-assisted workflows

17.7 Platform Health Metrics

- Monthly active users across stakeholder segments
- Platform uptime and reliability
- Customer support ticket volume and resolution time

18. Conclusion

18.1 Summary of Understanding

This Business Understanding Document has documented Scalezix's comprehensive analysis of the commercial real estate and facility management industry, the structural challenges facing building owners and vendors today, and the strategic logic underlying OfficeX's four-layer business model: Marketplace, Software as a Service, Managed Services, and Artificial Intelligence.

We understand OfficeX's ambition to extend beyond a simple vendor-discovery marketplace and become the comprehensive operating system for commercial workplace operations in India — addressing the full lifecycle from vendor discovery through ongoing operational management, with Artificial Intelligence serving as the long-term differentiation layer built upon accumulated platform data.

18.2 Validation Required

This document represents Scalezix's current understanding based on available information and independent industry research. Several sections throughout this document are explicitly flagged as assumptions requiring validation. We recommend a structured validation workshop with OfficeX stakeholders to confirm, correct, or refine these assumptions before proceeding to the Functional Requirement Specification and Technical Design Document.

18.3 Path Forward

Upon validation of this Business Understanding Document, Scalezix will proceed to develop the Functional Requirement Specification, translating the business understanding captured here into detailed, feature-level requirements, followed by the Technical Design Document, which will define the system architecture, data model, and engineering approach required to deliver the platform described throughout this document.

19. Glossary

Facility Management (FM): Services required to operate, maintain, and support commercial buildings, including housekeeping, security, electrical systems, heating, ventilation and air conditioning, fire safety, landscaping, and other operational services.

Integrated Facility Management (IFM): A comprehensive service model where multiple facility management services are delivered by a single service provider under one integrated contract.

Computer-Aided Facilities Management (CAFM): Software systems used to manage workplace operations, maintenance, assets, space utilization, work orders, compliance, and facility-related information.

Request for Quotation (RFQ): A formal procurement document issued to vendors requesting commercial and technical quotations for specific services or products.

Service Level Agreement (SLA): A documented agreement defining expected service performance, response times, quality metrics, and responsibilities.

Bill of Quantities (BOQ): A detailed document listing materials, labor, quantities, and associated costs required for a project.

Global Capability Center (GCC): An offshore or regional center established by multinational organizations to deliver business, technology, engineering, or operational services.

Know Your Customer (KYC): The verification process used to confirm the identity and regulatory compliance of customers or vendors.

Two-Sided Marketplace: A business model that creates value by facilitating interactions between two distinct user groups, in this case building owners and facility management vendors.

Network Effects: A phenomenon where a platform or service becomes more valuable as more people use it, particularly relevant in two-sided marketplace dynamics.

Software as a Service (SaaS): A software delivery model in which applications are hosted centrally and provided to customers on a subscription basis over the internet.

Marketplace Liquidity: The state in which a marketplace has sufficient buyers and sellers transacting regularly to be self-sustaining and provide reliable value to participants.

20. Appendix

Appendix A: Assumptions Requiring Validation

The following list consolidates all assumptions flagged throughout this document for ease of joint review with OfficeX stakeholders:

1. OfficeX's primary near-term focus is the operational and facility management layer rather than the property transaction layer (Section 3.5)
2. Managed Services will be introduced in a later phase rather than at initial platform launch (Section 5.4)
3. OfficeX will support early platform adoption through a hands-on, concierge-style onboarding approach for initial cohorts (Section 8.10)
4. Commission rates and structures will follow a percentage-of-transaction model as the primary mechanism (Section 9.5)
5. Managed Services will not be included in initial platform build scope but should be architecturally anticipated (Section 11.5)
